

Welding Electrodes "Made in Germany"

Kjellberg welding electrodes are quality products made in Germany which are manufactured at our location in Massen. In several process steps the rod electrodes are produced from high-quality raw material, each one designed for a particular welding task. Kjellberg Finsterwalde is Germany's oldest electrode manufacturer with more than 85 years of experience in this field. Oscar Kjellberg, who founded this company and gave it his name, developed the patent for the coated welding electrode. Untiltoday this tradition has been carried on by continuous research and development.

All our products are subject to close **quality inspections**. Load tests and chemical analyses are part of every manufacturing process.
